AMENDMENT TO THE CLAIMS

1.(currently amended) A process device for measuring a process variable of an industrial process; comprising:

a process variable sensor configured to sense the process variable;

- device circuitry coupled to the process variable sensor configured to process an output from the process variable sensor and provide an output related to the sensed process variable;
- a databus configured to carry data between <u>at least two</u> components of the process device;
 - safety response circuitry in the process device which is separate from the two components, the safety response circuitry comprising;
 - a device interface to couple to the process device and provide an output related to operation of a component of the process device, wherein the device interface comprises a connection to the databus of the process device which is used to transfer digital data between the <u>at least</u> two components of the device and a microprocessor of the device;
 - a component monitor to monitor data carried on the databus, and monitor operation of the component of the process device based upon the output from the device interface and responsively identify a safety event of the component indicative of a failure of the component and provide a safety event output; and
 - a safety response module to respond to the safety event of the component based upon the safety event output in accordance with a safety response; and
 - wherein the device interface component monitor and safety response module are isolated from other components of the process device to provide redundancy.

- 4. (original) The apparatus of claim 1 wherein the device interface comprises a sensor coupled to the process device.
- 5. (previously presented) The apparatus of claim 4 wherein the process device couples to a process control loop and the sensor monitors current flow in the process control loop.
- 6. (original) The apparatus of claim 5 wherein the component monitor compares the sensed current with a current value.
- 7. (original) The apparatus of claim 1 wherein the safety response module controls the current in a process control loop based upon a safety failure.
- 8. (original) The apparatus of claim 1 wherein the device interface comprises a watch dog circuit.
- 9. (previously presented) The apparatus of claim 1 wherein the device interface senses power drawn by circuitry of the process device.
- 10. (original) The apparatus of claim 1 wherein the device interface couples to a memory.
- 11. (previously presented) The apparatus of claim 10 wherein the component monitor detects errors in the data stored in the memory.
- 12. (original) The apparatus of claim 1 wherein the safety response module provides an alarm output.
- 13. (original) The apparatus of claim 1 wherein the safety response module disconnects the process device from a process control loop.

- 14. (original) The apparatus of claim 1 wherein the safety response module disconnects circuitry in the process device.
- 15. (original) The apparatus of claim 1 wherein the safety response module attempts to compensate for the safety failure.
- 16. (original) The apparatus of claim 14 wherein the safety response module corrects for errors in data in the device.
- 17. (original) The apparatus of claim 16 wherein the safety response module interpolates between data points in order to correct a data error.
- 18. (original) The apparatus of claim 16 wherein the safety response module holds a previous data point.
- 19. (original) The apparatus of claim 4 wherein the sensor comprises a voltage sensor.
- 20. (original) The apparatus of claim 4 wherein the sensor comprises a current sensor.
- 21. (previously presented) The apparatus of claim 1 wherein the device interface monitors data carried in a databus of the device.
- 22. (original) The apparatus of claim 1 wherein the component monitor comprises software implemented in a microprocessor of the device.
- 23. (original) The apparatus of claim 1 wherein the safety event comprises a possibility of a future component failure.

24. (original) The apparatus of claim 1 wherein the safety event comprises a detection of a component failure.

25. (cancelled)

- 26. (previously presented) The apparatus of claim 1 wherein the safety response module is implemented in a feature module which couples to a sensor module of the process device.
- 27. (previously presented) The apparatus of claim 1 wherein the safety response module is implemented in a feature module which couples to a plurality of sensor modules.
- 28. (previously presented) The apparatus of claim 26 wherein the component monitor monitors data from a sensor in the sensor module.
- 29. (original) The apparatus of claim 1 including a display and wherein the component monitors data sent to the display.
- 30. (cancelled)
- 31. (cancelled)
- 32. (previously presented) The apparatus of claim 1 wherein the component monitor an plurality of process devices.
- 33. (original) The apparatus of claim 1 wherein the component monitor and safety response module are implemented in software.

34. (previously presented) The apparatus of claim 33 wherein the software upgrades an existing process device.

35 - 53. (cancelled)
